

Applicative Intersection Types

Applicative Intersection Types

- ❖ It's more like a tutorial than a research report
- ❖ **Function application** in terms typed with intersection types
- ❖ Not directly related to applicative functor*

Table of Contents

- ❖ Background Introduction
- ❖ Motivation
- ❖ Ideas and its application
- ❖ Challenges & Solutions
- ❖ Conclusion

Table of Contents

Intersection type and Merge Operator

`1 , , true :: Int & Bool`

- ❖ Intersection type allows a term that can have multiple types
- ❖ Merge Operator creates a term which is an inhabitant of intersection type

λ_i and Type Directed Operational Semantics*

- ❖ λ_i is a calculus with intersection types and merge operator
- ❖ λ_i has a direct call-by-value operational semantics
- ❖ λ_i uses type annotation to guide reduction then further reduces value

λ_i and Type Directed Operational Semantics*

`succ` :: `Int` \rightarrow `Int`
`not` :: `Bool` \rightarrow `Bool`
`succ` , , `not` :: (`Int` \rightarrow `Int`) & (`Bool` \rightarrow `Bool`)

(`succ` , , `not`) : (`Int` \rightarrow `Int`) $\leadsto \rightarrow$ `succ`
(`succ` , , `not`) : (`Bool` \rightarrow `Bool`) $\leadsto \rightarrow$ `not`

(`succ` , , `not`) : (`Int` \rightarrow `Bool`) $\leadsto \rightarrow$ type check error!

Table of Contents

- ❖ Background Introduction
- ❖ Motivation
- ❖ Ideas and its application
- ❖ Challenges & Solutions
- ❖ Conclusion

Limitations in λ_i

`((succ ,, not) : Bool → Bool) true`

`~ → not true`

`~ → false`

`(λf. f 1 : (Int → Int) → Int) ((succ ,, not) : Int → Int)`

`~ → (λf. f 1 : (Int → Int) → Int) succ`

`~ → succ 1`

`~ → 2`

Limitations in λ_i

$((\text{succ } ,, \text{ not}) : \text{Bool} \rightarrow \text{Bool}) \text{ true}$

$\rightsquigarrow \text{ not true}$

$\rightsquigarrow \text{ false}$

we already knew the information from arguments!!

$(\lambda f. f \ 1 : (\text{Int} \rightarrow \text{Int}) \rightarrow \text{Int}) ((\text{succ } ,, \text{ not}) : \text{Int} \rightarrow \text{Int})$

$\rightsquigarrow (\lambda f. f \ 1 : (\text{Int} \rightarrow \text{Int}) \rightarrow \text{Int}) \text{ succ}$

$\rightsquigarrow \text{ succ } 1$

$\rightsquigarrow 2$

we already knew the information from function!!

Programmers' Intuition

`(succ , , not) true`

`~ → not true`

`~ → false`

automatically pick during compilation

`(λf. f 1 : (Int → Int) → Int) (succ , , not)`

`~ → (λf. f 1 : (Int → Int) → Int) succ`

`~ → succ 1`

`~ → 2`

- ❖ Conclusion

Ideas

- ❖ instead of using type annotation, we obtain types from arguments*

Bi-Directional Type Checking

❖ Infer mode : $\Gamma \vdash e \Rightarrow A$

❖ Check mode: $\Gamma \vdash e \Leftarrow A$

$$\frac{\Gamma \vdash e_1 \Rightarrow A \rightarrow B \quad \Gamma \vdash e_2 \Leftarrow A}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{ T-App}$$

Application mode: $\Gamma \mid \Psi \vdash e \Rightarrow A$

$$\frac{\Gamma \vdash e_1 \Rightarrow A \rightarrow B \quad \Gamma \vdash e_2 \Leftarrow A}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{T-App}$$

Becomes

Ψ is a argument stack!

$$\frac{\Gamma \vdash e_2 \Rightarrow A \quad \Gamma \mid \Psi, A \vdash e_1 \Rightarrow A \rightarrow B}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{T-App}$$

Case Study

type check without type reconstruction!

$$\frac{\Gamma \vdash e_2 \Rightarrow A \quad \Gamma \mid \Psi, A \vdash e_1 \Rightarrow A \rightarrow B}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{ T-App}$$

$$\frac{1 \Rightarrow \text{Int} \quad \text{Int} \vdash (\lambda x. x) \Rightarrow \text{Int} \rightarrow \text{Int}}{\text{---} \quad (\lambda x. x) 1 \Rightarrow \text{Int}} \text{ T-App}$$

Case Study

$$\frac{\Gamma \vdash e_2 \Rightarrow A \quad \Gamma \mid \Psi, A \vdash e_1 \Rightarrow A \rightarrow B}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{ T-App}$$

$$\frac{\text{true} \Rightarrow \text{Bool} \quad \text{Bool} \vdash (\text{succ} \ , \ , \ \text{not}) \Rightarrow \text{Bool} \rightarrow \text{Bool}}{\text{(succ} \ , \ , \ \text{not) true} \Rightarrow \text{Bool}} \text{ T-App}$$

Case Study

we need an algorithm to pick a type from intersection type!

$$\frac{\Gamma \vdash e_2 \Rightarrow A \quad \Gamma \mid \Psi, A \vdash e_1 \Rightarrow A \rightarrow B}{\Gamma \vdash e_1 e_2 \Rightarrow B} \text{ T-App}$$

$$\frac{\text{true} \Rightarrow \text{Bool} \quad \text{Bool} \vdash (\text{succ} \ , \ , \ \text{not}) \Rightarrow \text{Bool} \rightarrow \text{Bool}}{\text{(succ} \ , \ , \ \text{not) true} \Rightarrow \text{Bool}} \text{ T-App}$$

Application Subtyping

$$\frac{}{\emptyset \vdash A \leq A} \text{AS-Ref1}$$

$$\frac{C \leq A \quad \Psi \vdash B \leq D}{\Psi, C \vdash A \rightarrow B \leq C \rightarrow D} \text{AS-Fun}$$

$$\frac{\Psi, C \vdash A \leq D}{\Psi, C \vdash A \& B \leq D} \text{AS-L}$$

$$\frac{\Psi, C \vdash B \leq D}{\Psi, C \vdash A \& B \leq D} \text{AS-R}$$

Application Subtyping

$$\frac{}{\emptyset \vdash A \leq A} \text{AS-Ref1}$$

$$\frac{C \leq A \quad \Psi \vdash B \leq D}{\Psi, C \vdash A \rightarrow B \leq C \rightarrow D} \text{AS-Fun}$$

----- Sub-Ref1

$\text{Bool} <: \text{Bool}$

----- As-Ref1

$. \vdash \text{Bool} <: \text{Bool}$

----- As-Fun

$\text{Bool} \vdash \text{Bool} \rightarrow \text{Bool} <: \text{Bool} \rightarrow \text{Bool}$

----- AS-R

$\text{Bool} \vdash (\text{Int} \rightarrow \text{Int}) \& (\text{Bool} \rightarrow \text{Bool}) <: \text{Bool} \rightarrow \text{Bool}$

Metatheory of Application Subtyping

- ❖ $(\Psi \rightarrow B)$ If $\Psi = A_1, A_2, \dots, A_n$, then $\Psi \rightarrow B$ means the arrow type $A_n \rightarrow \dots \rightarrow A_2 \rightarrow A_1 \rightarrow B$
- ❖ $(\Psi \vdash <: \text{to } <:)$ If $\Psi \vdash A <: B$, then $A <: B$
- ❖ $(<: \text{to } \Psi \vdash <:)$ If $A <: \Psi \rightarrow B_1$, then $\exists B_2, \Psi \vdash A <: \Psi \rightarrow B_2$ and $B_2 <: B_1$

Case Study

$$\frac{\Gamma \mid \Psi \vdash e_1, , e_2 \Rightarrow B \quad \Psi, A \vdash B \leq C}{\Gamma \mid \Psi, A \vdash e_1, , e_2 \Rightarrow C} \text{ T-Merge-Pick}$$

$$\begin{array}{l} \vdash (\text{succ } , , \text{not}) \Rightarrow (\text{Int} \rightarrow \text{Int}) \& (\text{Bool} \rightarrow \text{Bool}) \\ \text{Bool} \vdash (\text{Int} \rightarrow \text{Int}) \& (\text{Bool} \rightarrow \text{Bool}) \Rightarrow \text{Bool} \rightarrow \text{Bool} \\ \hline \text{true} \Rightarrow \text{Bool} \quad \text{Bool} \vdash (\text{succ } , , \text{not}) \Rightarrow \text{Bool} \rightarrow \text{Bool} \quad \text{T-Merge-Pick} \\ \hline \text{--- T-App} \\ (\text{succ } , , \text{not}) \text{ true} \Rightarrow \text{Bool} \end{array}$$

Table of Contents

- ❖ Background Introduction
- ❖ Motivation
- ❖ Ideas and its application
- ❖ Challenges & Solutions
- ❖ Conclusion

Challenge I: Ambiguity

$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) <: (\text{Int} \rightarrow \text{Int})$

----- As-L

$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) \ \& \ (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Int})$

$\text{Int} \vdash (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Bool})$

----- As-R

$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) \ \& \ (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Bool})$

Challenge I: Ambiguity

type with same inputs should be rejected!

$$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) <: (\text{Int} \rightarrow \text{Int})$$

----- As-L

$$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) \ \& \ (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Int})$$
$$\text{Int} \vdash (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Bool})$$

----- As-R

$$\text{Int} \vdash (\text{Int} \rightarrow \text{Int}) \ \& \ (\text{Int} \rightarrow \text{Bool}) <: (\text{Int} \rightarrow \text{Bool})$$

Solution I: Ambiguity

$$\frac{\Psi, C \vdash A \leq D \quad \textit{not} (B \textit{ in } \textit{NextInputs}(A))}{\Psi, C \vdash A \& B \leq D} \text{AS-L}$$

$$\frac{\Psi, C \vdash B \leq D \quad \textit{not} (A \textit{ in } \textit{NextInputs}(B))}{\Psi, C \vdash A \& B \leq D} \text{AS-R}$$

Challenge II: Semantics

$$\frac{\Gamma \mid \Psi \vdash e_1, , e_2 \Rightarrow B \quad \Psi, A \vdash B \leq C}{\Gamma \mid \Psi, A \vdash e_1, , e_2 \Rightarrow C} \text{ T-Merge-Pick}$$

in some process of function application

Semantics should mimic the typing

Solution II: Semantics

$$\frac{\textit{ptype}(vl) \vdash \textit{ptype}(v_1, , v_2) \leq \textit{ptype}(v_1) \quad v_1 \textit{ vl } \rightsquigarrow e}{v_1, , v_2 \textit{ vl } \rightsquigarrow e} \text{App-Merge-L}$$

$$\frac{\textit{ptype}(vl) \vdash \textit{ptype}(v_1, , v_2) \leq \textit{ptype}(v_2) \quad v_2 \textit{ vl } \rightsquigarrow e}{v_1, , v_2 \textit{ vl } \rightsquigarrow e} \text{App-Merge-R}$$

Challenges III: Syntax and value

- ❖ Value must carry some type annotation to preserve in typed reduction
- ❖ Annotating value would trigger typed reduction
- ❖ We need information of types in reduction
- ❖ Narrowing lemmas has conflicts with unannotated lambda

$$\frac{v \rightsquigarrow A v'}{v : A \rightsquigarrow v'} \text{ Step-Anno-V}$$

Solution III: Syntax and value

No

$$p := T \mid N \mid \lambda x . x \mid p_1, , p_2$$
$$v := p : A \mid \lambda x . x$$

No

$$p := T \mid N \mid \lambda x . x$$
$$v := p : A \mid v_1, , v_2$$
$$r := v \mid \lambda x . x$$

Yes!

$$p := N \mid \lambda x : A . x$$
$$v := p : A \mid v_1, , v_2$$

Solution III: Value

- ❖ $1 : \text{Top}$ behaves as a term Top
- ❖ $\lambda x : \text{Int} . x$ is not a value
- ❖ $\lambda x : \text{Int} . x : (\text{Int} \rightarrow \text{Int})$ is a value
- ❖ $1 : \text{Int} , , \text{true} : \text{Bool}$ is a value

Challenge IV: Meta-theory

- ❖ Current lemmas between Application Subtyping and Subtyping is **not strong enough**
- ❖ $\Gamma \mid \Psi \vdash e \Rightarrow A$ is generalized from $\Gamma \vdash e \Rightarrow A$, but properties between two formally and intuitively are still **undiscovered**
- ❖ Preservation/Progress **re-statement**

Unresolved IV: Meta-theory

- ✧ If $\Gamma \mid \Psi, A \vdash e \Leftrightarrow A \rightarrow B$, then $\Gamma \mid \Psi \vdash e \Leftarrow A \rightarrow B$
- ✧ If $\Gamma \mid \emptyset \vdash v \Rightarrow A$ and $\Psi \vdash A <: B$, then $\Gamma \mid \Psi \vdash v \Rightarrow B$

Table of Contents

- ❖ Background Introduction
- ❖ Motivation
- ❖ Ideas and its application
- ❖ Challenges & Solutions
- ❖ Conclusion

Meta-theorist's Perspective

- ❖ It's a kind of **type inference** using bidirectional typing
- ❖ It combines **application mode** and **check mode** in λ_i

Meta-theorist's Perspective

- ❖ It's a kind of **type inference** using bidirectional typing
- ❖ It combines **application mode** and **check mode** in λ_i

retain the possibility of writing type annotations!

Programmer's Perspective

- ❖ It reduces some unnecessary typing annotations
- ❖ It enables function overloading in a type-safe manner
- ❖ It improves efficiency in some sense

Programmer's Perspective

```
succ ,, not 4 -- type checks
```

```
succ ,, not 'c' -- doesn't type check
```

```
(f: Int → Int) ,, (g : Int → Bool) 1 -- ambiguity error
```

- ❖ It reduces some unnecessary typing annotations
- ❖ It enables function overloading in a type-safe manner
- ❖ It improves efficiency in some sense **Less runtime dispatch!**

Thanks for listening,
and hope you enjoy!
